DETAILED ACTION

Election/Restrictions

Applicant's election without traverse of Species I in the reply filed on 2/22/06 is acknowledged.

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 5 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. The language of the claim is confusing with regard to the output channels. The claim recites "attenuating an amplitude of the original sound of one channel is outputted to the one channel" whereby "the one channel" is vague. In addition, the claim recites "outputted to the other channel" indicating the use of two output channels, but such language being absent from the claim. Lastly, the language "said processed sound being formed by a process where an amplitude attenuation processed sound formed by ..." is unwieldy.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 5-7 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Beller et al, US Patent 5,895,220 in view of Kamada et al, US Patent 5,995,631. Beller discloses an auditory sensing training method comprising switching between original signal O_e and a parametric signal P_s . See column 9 line 24 – column 11 line 18. The parametric signal is a processed sound which is alternated with the original sound. Beller does not disclose that the processed sound is formed by attenuating one channel signal and superimposing that signal to the other channel and outputting the attenuated channel signal and the superimposed channel signal. In figure 39, Kamada et al disclose an method of sound localization that attenuates a signal via multiplier 200 in one channel L_{in} and superimposes the signal to the signal R_{in} at adder 212 in the other channel. It would have been obvious to one of ordinary skill in the art at the time of invention to modify Beller et al per the teachings of Kamada et al for the purpose of training the auditory sense of a person using sound localization which improves its effectiveness. Claims 5 and 17 are rejected. As to claim 6, the combination inherently meets the limitations. Regarding claim 7, the alternating process varies (see column 11 lines 1-4).

Allowable Subject Matter

Claim 16 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
